(D) H<sup>+</sup>

Ans: (A)

**Hints:**

## DESCRIPTIVE TYPE QUESTIONS

### SUB: PHYSICS & CHEMISTRY

1. A shell of mass m is at rest initially. It explodes into three fragments having masses in the ratio 2 : 2 : 1. the fragments having equal masses fly off along mutually perpendicular direction with speed V. What will be the speed of the third (lighter) fragment?

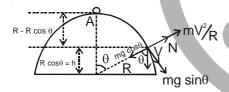

From conservation of momentum

$$O = 2mv\sqrt{2} + mv_1$$

$$V_1 = -2\sqrt{2} v$$

Hence, velocity of third part is  $2\sqrt{2}$  v at an angle of 135° with either part.

- 2. A small spherical ball of mass m slides without friction from the top of a hemisphere of radius R. AT what height will the ball lose contact with surface of the sphere?
  - **A.** If the ball lose contact at B then, from conservation of energy.

$$\operatorname{mgR}\left(1-\cos\theta\right) = \frac{1}{2}\operatorname{mv}^{2}$$

$$v^2 = 2gR (1 - \cos\theta) \dots (i)$$

At B

$$N + \frac{mV^2}{R} = mg \cos \theta$$

When the ball will lose the contact

$$N = O$$

$$\arg\cos\theta = \frac{\pi v^2}{R}$$

$$V^2 = gR \cos \theta$$
.....(ii)

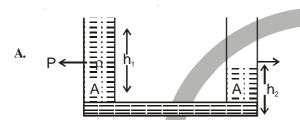

$$2\mathbf{K}g(1-\cos\theta)=g\mathbf{K}\cos\theta$$

$$2-2\cos\theta=\cos\theta$$
.

$$2 = 3 \cos \theta$$
.

$$h = R \cos \theta = \frac{2R}{3}$$

3. Two identical cylindrical vessels, with their bases at the same level, each cotain a liquid of density p. The height of liquid in one vessel in h<sub>1</sub> and that in the other is h<sub>2</sub>. The area of either base is A. What is the work done by gravity in equalizing the levels when the vessels are interconnected?

Let find height = h

$$\therefore h = \left(\frac{h_1 + h_2}{2}\right)$$

decerese in height

$$\Delta h = h_1 - \left(\frac{h_1 + h_2}{2}\right) = \left(\frac{h_1 - h_2}{2}\right)$$

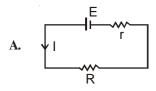

Mass of liquid

$$m = \frac{\left(h_1 - h_2\right)}{2} \rho A$$

∴ Work done

$$W = \left[ \left( \frac{h_1 - h_2}{2} \right) \rho A \right] \left[ \frac{h_1 - h_2}{2} \right] = \frac{\left( h_1 - h_2 \right)^2}{4} g \rho A$$

4. A battery of emf E and internal resistance r is connected across a pure resistive device (such as an electric heater) of resistance R. Prove that the power output of the device will be maximum if R = r.

$$I = \frac{E}{R + r}$$

Power 
$$P = I^2R = \frac{E^2R}{(R+r)^2}$$

For maximum power

$$\frac{dp}{dR} = 0$$

$$E^{2} \left[ \frac{(R+r)^{2}.1-R.2(R+r)}{(R+r)4} \right] = 0$$

$$R+r-2R=0$$

$$r = R$$

5. A radioactive isotope X with half life  $1.5 \times 10^9$  yrs. decays into a stable nucleus Y. A rock sample contains both elements X and Y in ratio 1:15. Find the age of the rock.

A. 
$$t = 0, 16$$
  $t = 1, 1$ 

$$T_{\frac{1}{2}} = 1.5 \times 10^9 \text{ yr}$$

$$N = N_o \left(\frac{1}{2}\right)^n$$

$$1 = 16 \left(\frac{1}{2}\right)^n$$

$$\left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^4 \therefore n = 4$$

$$\therefore \text{ time } t = 4 \times 1.5 \times 10^9 = 6 \times 10^9 \text{ yrs}$$

6. The bacterial growth follows the rate law,  $\frac{dN}{dt} = KN$  where 'K' is a constant and 'N' is the number of bacteria cell at any time. If the population of bacteria (no. of cell) is doubled in 5 minutes, find the time by which the population will be eight times of the initial one.

A. 
$$\frac{dN}{dt} = KN$$
 (1st order kinetics)

$$\Rightarrow$$
 N = N<sub>0</sub>e<sup>kt</sup> (integrating)

$$\therefore$$
 in 5 min, N = 2N<sub>0</sub>

$$K = \frac{2.303}{t} \log \frac{N}{N_0}$$

$$\Rightarrow K = \left(\frac{2.303}{5} \log \frac{2N_o}{N_o}\right) \min^{-1}$$

$$\Rightarrow K = \frac{2.303}{5} \log 2$$

for  $8N_0$ 

$$t = \left(\frac{2.303}{\frac{2.303}{5} \log 2}\right) \log \frac{8N_{o}}{N_{o}}$$

$$\Rightarrow t = \frac{5 \times 3 \log 2}{\log 2} = 15 \min$$

- ∴ time required is 15 min.
- 7. In 'x' ml 0.3 (N) HCl, addition of 200 ml distilled water or addition of 100 ml 0.1 (N) NaOH, gives same final acid strength. Determine 'x'.
  - **A.** When  $200 \text{ ml H}_2\text{O}$  is added to x ml solution

$$(x)(0.3) = (x + 200)(Y) \rightarrow \text{ final conc.}$$

$$Y = \frac{0.3x}{200 + x}$$

in 2nd case

Number of equivalents of HCl after NaOH addition

$$\frac{0.3x}{1000}$$
 - 0.01 (no of eq. of NaOH added = 0.01)

∴ conc. would be 
$$\frac{\left\{\frac{0.3x}{1000} - 0.01\right\}}{100 + x} \times 1000(N)$$

by condition,

$$\frac{\left\{\frac{0.3x}{1000} - 0.01\right\}1000}{100 + x} = \frac{0.3x}{200 + x} \Rightarrow \frac{0.3x - 10}{100 + x} = \frac{0.3x}{(200 + x)} \Rightarrow (0.3x - 10) \times (200 + x) = (0.3x)(100 + x)$$

$$\Rightarrow$$
 60x - 2000 + 0.3 x<sup>2</sup> - 10x = 30x + 0.3x<sup>2</sup>

$$\Rightarrow$$
 20x = 2000  $\Rightarrow$  x = 100 ml

- 1. What are poikilothermic animals?
  - **A.** The body temperature of poikilothermic animals (cold blooded animals) changes according to environmental temperature. Example are invertebrates, fishes, amphibians and reptiles.
- 2. Write two functions of juxtaglomerular apparatus.
  - **A.** The Juxta glomerular apparatus (JGA) possesses Juxta glomerular cells and Macula densa. The Juxta glomerular cells secrete renin which regulates RAAS mechanism. Macula densa responds to the change in the mineral ion concentration of glomerular filtrate.

Pinocytosis	Phagocytosis
1. It is "Cell drinking" phenomenon where bulk intake of extracellular fluid with the help of vesicle called pinosome takes place.	It is a "Cell eating" phenomenon where bulk intake of solid material from outside to inside of a cell takes place with the help of phagosome.

A.

  - **A.** Four important functions of plasma membrane are :
  - (i) Involved in active and passive transport
  - (ii) Involved in a variety of cellular processess such as cell adhesion, ion conductivity & cell signalling.
  - (iii) As a cell envelope it contain the protoplasm thus protective in nature.
  - (iv) In prokaryotes, plasma membrane is the site of E.T.S.
- 6. What is bioaccumulation?
  - **A.** Bioaccumulation is the accumulation of toxic substance at a rate greater than at which the substance is lost by an organism.

Longer the biological half life of the accumulated substance, greater is the risk of bioaccumulation.
